

I'm not robot!

Bitdefender antivirus free edition review. How to turn off bitdefender antivirus free edition. Bitdefender antivirus free edition vs windows defender. Bitdefender antivirus free edition cskavari. Bitdefender antivirus free edition filehippo. Is bitdefender antivirus free edition good. Bitdefender antivirus free edition removal tool. How to remove bitdefender antivirus free edition.

Some antivirus companies have built their names and fame on free antivirus tools—Avast, AVG, and Avira, for example. BitDefender added a free offering only after its commercial antivirus was well established and wound up terminating that product at the end of 2021. Now BitDefender Antivirus Free for Windows is back, and better than ever. Where the previous free edition bore little resemblance to BitDefender's other security products, the current one is very clearly a part of the product line, and it includes several features that were previously reserved for paying customers. It's worth a look, if you need high-powered antivirus protection at the lowest possible price. Installing BitDefender FreeGetting BitDefender Free running on your system is quick and easy. You need to sign up for a BitDefender account to activate the product (or sign in if you already have one). After installation it offers a Device Assessment which includes a quick scan for malware as well as a scan for items left over from old infestations. For testing purposes, I skipped the assessment. There's also an option to have it run in the background while you get started using the product. Like other members of the BitDefender product line, the free edition defaults to displaying a security dashboard, with a left-rail menu that offers detailed access to features. Security recommendations occupy the top of the rest of the window, with a half-dozen Quick Action icons below. Only two of these, Quick Scan and System Scan, are enabled. The ability to choose from a selection of other features for the remaining Quick Actions isn't useful in the free edition, as none of the other possible choices are enabled. The Protection page looks just like what you see in BitDefender Internet Security, but only Antivirus, Advanced Threat Defense, and Online Threat Prevention are enabled. The other components display the purple lock icon that means they're not available for free. It's completely reasonable that you don't get the Firewall and Antispam features, since even the commercial antivirus doesn't have those. But free users also don't get the benefit of the Vulnerability scan or the important Ransomware Remediation feature, both featured in the commercial edition. Everything on the Privacy page is locked. That makes sense for the suite-specific webcam protection and parental control. Users of the free edition do miss out on BitDefender's Safepay, a hardened browser designed to protect online financial transactions. The Anti-tracker component is likewise available in the commercial antivirus but not the free one. The Utilities page in the commercial antivirus includes a simple File Shredder and a profile system that automatically adjusts the antivirus configuration based on activity profiles. You don't get those features for free, nor the suite-specific tuneup and anti-theft components. As with Privacy, everything on the Utilities page is locked. You should run a full scan right after installation, to root out any malware that infested the system before you installed antivirus. At the first full scan, BitDefender warns that "due to its complexity it might take a while to complete", but that subsequent scans should go much more quickly. Indeed, the initial scan took over two hours, twice the current average of 63 minutes. As promised, a repeat scan went much more quickly, finishing in just 10 minutes. Kaspersky Anti-Virus also performed impressive optimization in its latest test, going from 70 minutes for the initial scan down to 4.5 minutes for a repeat scan. In theory, real-time protection should handle any malware problems after the full scan, but for an extra layer of security you can schedule a daily, weekly, or monthly scan, scheduling quick, full, and custom scans separately. The previous free edition didn't include scheduling or custom scans. The current free edition still doesn't let you use the Rescue Environment, a premium-only feature that reboots the computer into a non-Windows platform suitable for removing even the most persistent malware. Excellent Lab ResultsWhile BitDefender Free doesn't include every feature of the commercial edition, its core antivirus engine is the same as what the independent labs test, BitDefender Antivirus Plus. The labs do make it clear that their results are only guaranteed for the precise product they tested. Still, it's worth looking at the excellent scores the commercial edition earned. Three of the four labs that I follow include BitDefender in their testing. In the three-part test regularly reported by AV-Test Institute (Opens in a new window), antivirus programs can earn up to six points each for effective protection, low impact on performance, and few usability problems (meaning false positives). BitDefender missed a perfect 18 points due to a few false positives that cost it a half-point in usability, but 17.5 points is sufficient for the lab to name it a top product. Avira Free Security, Kaspersky, Microsoft, and Norton are among the products that managed a perfect score in the latest test. The researchers at AV-Comparatives (Opens in a new window) perform a wide variety of tests; I follow three of them. Products that pass a test earn Standard certification, while those that go significantly beyond the minimum needed to pass receive Advanced or even Advanced+ certification. BitDefender took Advanced+ in the latest instances of all three tests, as did Avast, AVG, and McAfee. The tests performed by MRG-Effitas (Opens in a new window) are a bit different from the rest. To pass this lab's banking Trojans test, a product needs a perfect score; anything less is failure. Another test using a wide variety of malware offers two passing levels. If a product absolutely blocks every installation attempt, it passes at Level 1. If some malware gets through, but is eliminated within 24 hours, that earns Level 2. Anything else is failure. BitDefender was among the 60% of tested products that passed the banking test. It reached Level 2 certification in the broad-spectrum test, along with F-Secure and Microsoft Windows Defender Security Center. Only ESET and Norton managed Level 1 certification in the latest test. SE Labs (Opens in a new window) attempts to simulate the real world of malware as closely as possible for testing purposes, using a capture/replay system to present each product with a real-world Web-based attack. Certification from this lab comes at five levels, AAA, AA, A, B, and C. Alas, BitDefender hasn't appeared in results from SE Labs for many months now. I have contrived an algorithm that maps all the test results onto a 10-point scale and returns an aggregate lab score for every product that has results from at least two labs. Avast Free Antivirus, Kaspersky, and Microsoft are among the products that appear in reports from all four labs. In terms of aggregate score, Kaspersky rules that group, with 9.9 of 10 possible points. Among products tested by three labs, AVG, BitDefender, and F-Secure are tied at the top, with 9.8 points apiece. Good Malware ProtectionEven when lab results are plentiful, I always run my own hands-on testing, just to get a feel for the way a product handles malware. If I don't get enough data from the labs, my hands-on malware protection test is the only way I can rate antivirus accuracy. In this case, the labs have already made it very clear that BitDefender's technology is top-notch. When I opened my folder of samples, BitDefender started picking off those it recognized. A simple "Disinfection in progress" notification remained in place for perhaps 10 minutes while samples gradually disappeared from the folder. The antivirus requested a reboot to complete its cleanup process, which I found odd given that none of the malware samples had been executed. Old request or not, I complied. I maintain a second set of samples, each hand-modified to be different from anything the antivirus has encountered. I change the filename, append nulls to change the size, and overwrite some non-executable bytes with random text. As in previous tests, BitDefender currently misses more than a third of these hand-modified samples. Remember, this test simply measures on-sight recognition, as I don't launch the tweaked items. I tested BitDefender's commercial edition alongside the free one; results were identical. Both products detect 90% of the samples and score 8.9 points. While decent, that's the lowest score among products tested with my new collection of malware samples. However, when my results don't jibe with those of the independent testing labs, I give the testing labs significantly more weight. Tested against the same set of samples, Norton AntiVirus Plus earns the best score. It detects 100% of the samples and scores 9.9 of 10 possible points. McAfee and Webroot tie for second place, with 98% detection and 9.7 points. When BitDefender defends against a malware attack, it pops up a small notification, with an option to learn more about what happened. In many cases, the available information includes an attack timeline, something not found in the previous free edition. The timeline shows just how the malware got onto your system and how far it got before BitDefender nabbed it. It also includes an "alternative outcome," driving home the point that, without BitDefender, the attack would have succeeded. When I collect and curate a new set of malware samples for testing, I deliberately draw from samples that are a few months old, so as not to give to a disadvantage to the first products tested with the new collection. Because it takes a great deal of time and effort to prepare a new set of real-world malware, I use the same samples for up to a year. My malicious URL blocking test, on the other hand, uses only the latest and most current malware. This test starts with a feed of very new discoveries generously supplied by MRG-Effitas. Each antivirus gets two chances to prevent malware being downloaded from these URLs. It can block all access to the URL for full credit, or it can eliminate the malware payload during or after download, also for full credit. What I don't want to see is a verified malicious program downloaded without any interference from the antivirus. BitDefender blocks access to nasty URLs below the browser level, so it doesn't have to install a browser extension. It blocked 61% of the dangerous links at the URL level, diverting the browser to a warning page. For another 37%, the real-time antivirus did the job, in most cases identifying the threat before the download even finished. BitDefender's total of 98% protection is quite good, though it managed a perfect 100% when last tested. McAfee, Norton, and Sophos Home Premium retain their 100% scores from their latest tests. Perfect Phishing DetectionThe most perfect malware-detection system in the world can't help you if you fall for a phishing scam and give away your precious login credentials. Phishing websites masquerade as banks, online merchants, and even gaming websites, and they do their best to entice you with a perfect replica of the actual login page. When you enter your credentials on the fake page, the fraudsters own your account. They get caught and blacklisted quickly enough, but they just scoop up their winnings and move on. To test how well a product keeps its users safe from this kind of fraud, I scrape phishing URLs from a variety of reporting sites. For testing I collect both verified phishing frauds and URLs so new that they haven't been analyzed and verified. I run the test simultaneously on the product under testing and on instances of Chrome, Edge, and Firefox, relying on the phishing protection built into the three browsers. For each suspected fraud, I launch the URL in all four browsers and record the results. If any of the four can't load the URL, I discard it. If the page doesn't actively attempt to capture login credentials for a secure site, I discard it. After checking several hundred possible fraudulent URLs, I run the numbers. On detecting a phishing page, BitDefender correctly diverts the browser to a safe warning page, just as it does on detecting a dangerous page. The warning page offers a brief explanation and allows a bold (or foolish) user to ignore the risk and visit the page regardless. In the current test, BitDefender detects 100% of the verified frauds, a perfect score. In their own most recent tests, F-Secure, McAfee AntiVirus Plus, and Norton also scored 100%. However, BitDefender opens the widest lead compared with the built-in browser protection, scoring an average of 31% better. See How We Test Security SoftwareWhat's Not HereAt this point, I've described the entirety of what BitDefender Free does. The feature list of the full, premium BitDefender Antivirus goes way beyond this. Please read my review (linked above) for full details on what you get by paying for the full edition. I'll summarize those bonus features here. The BitDefender Wallet component is a complete, if basic, password manager. It captures and replays passwords, generates strong passwords, and fills Web forms. It doesn't try for advanced features like multi-factor authentication or automatic password updating. BitDefender SafePay is a hardened separate desktop with a secure browser designed to keep your sensitive online transactions safe. Processes running under SafePay are isolated from processes on the regular desktop. The Wi-Fi Advisor both checks your home network's security and warns when you connect to an insecure network. If the antivirus can't eliminate a particularly nasty malware specimen, you can reboot into the Rescue Environment to handle the threat outside of Windows. Using the File Shredder you can delete sensitive files permanently, beyond the possibility of forensic recovery. A Search Advisor add-in marks up dangerous websites in search results. And the Vulnerability Scan checks for missing security updates and for weak Windows passwords. The enhanced ransomware protection layer watches for behaviors that suggest ransomware, to protect your important documents. And none of these bonus features are present in the free edition. The Anti-tracker browser extension aims to keep advertisers, analytics, and all other trackers from snooping on your browsing activity. When you visit a page, its toolbar icon displays the number of trackers blocked. You can click for details, including an estimate of how much blocking the trackers sped up page load time. This, too, isn't in the free edition. Effective Basic ProtectionBitDefender Antivirus Free for Windows doesn't have the wealth of features that makes its for-pay sibling almost a suite. It does contain the same basic protection against malware, malicious websites, and fraudulent sites, though it lacks the premium edition's ransomware-specific protective layer. If you want every drop of the famed BitDefender malware protection, and you can spare the cash, Editors' Choice winner BitDefender Antivirus Plus is worth the cost. But if the budget won't stretch that far, the free edition is still very good. Avast One Essential extends protection to Windows, macOS, Android, and iOS devices. It includes a firewall, a bandwidth-limited VPN, and a variety of privacy-protection features. Kaspersky Security Cloud Free also protects devices on all popular platforms. It gets near-perfect scores from the independent labs and comes with suite features that include a free, feature-limited VPN. These two are our Editors' Choice picks for free antivirus utilities. Of course, since they're all free, you can give them both and BitDefender a try before settling on your favorite. BitDefender Antivirus Free for Windows Pros Same core antivirus protection as for-pay BitDefender Excellent scores from independent testing labs Very good scores in our hands-on tests Includes some features absent in previous free edition Free View More Cons Lacks ransomware-specific protection First-time full scan unusually slow The Bottom Line BitDefender Antivirus Free for Windows offers the same core antivirus technology found in the commercial BitDefender Antivirus Plus, focusing on the essential task of antivirus protection with minimal add-ons.
